The Technology Division of

Whether you are planning a network installation or a migration to a new network operating system, are in need of a wireless network, or are simply upgrading your current network, CompStar Technologies makes the process easier and more productive.

CompStar Technologies business-savvy network consultants are not only competent technically, they are capable of solving your real world problems using the best and most appropriate technologies.

We carefully analyze your business situation and strategic objectives in order to recommend solutions that meet those objectives.

CompStar Technologies will work with you in a variety of ways to achieve the best solution. We can provide a complete hardware and software solution for your network, while working with your internal staff or your preferred hardware vendor to arrive at the best and most cost effective network solution.

A few examples of CompStar network projects include:

Data Protection and Network Security. Information used in today's business is critical to a smooth functioning organization, if not its very survival. CompStar can review existing network security and data protection, and, if necessary, implement new or additional approaches to protect against external hackers, internal mischief, viruses, and data loss.

Linking Remote Sites. Organizations, today, need continuous communication and data exchange with all types of remote sites out-of-state facilities, a plant across town,

field offices, traveling staff, home-based workers, etc.. CompStar Technologies will fashion the most cost-effective and secure solution, whether it consists of a Wide Area Network (WAN), a centralized Citrix solution, a Virtual Private Network (VPN), or multiple technologies.

TCO Reduction. Despite falling hardware costs, the total cost of ownership (TCO) for personal computers and networks often remains high due to support needs and unproductive user time. CompStar Technologies will review your network to identify ways to keep your costs low and your users productive. Solutions include network management products like Microsoft Systems Management Server and Novell Zenworks. Techniques that include standardization of user desktops and tools, plus approaches tailored specifically to your environment.

Internet and E-Commerce. Today, an organization's clients and partners expect to interact with all parts of the organization instantly, using e-mail, messaging, online inquiries and online transactions. Both business-to-business and consumer environments need robust technical solutions. CompStar Technologies will implement the systems you need to provide this across all members of your organization who need it, and can also install the security and usage controls to reduce risk and prevent abuse.

The CompStar Difference. When CompStar Technologies designs and installs your network, you are adding a serious player to your business team. CompStar isn't a group of "propeller heads" - we are business professionals committed to helping your organization be successful.
