New Technology Revolutionizes Surveillance

Remember the days when “video surveillance” meant coaxial cable running between a bulky camera and a grainy black & white monitor? Or when recording surveillance data meant frequent swapping of VHS cartridges?

The world of video surveillance has changed, and CompStar can help you deploy the right technology to keep your business both **secure** and **productive**. Today’s video systems employ sophisticated digital cameras that can be easily retargeted and zoomed from a remote loca-

tion. The signals travel over the same kind of cable that your network data uses, and can be viewed over internal networks and even via the Internet. Plus, instead of requiring bulky, low quality VHS tapes, now data can be managed by computer and stored on hard drives, automatically recycling disk space after a preset time and permitting easy retrieval as needed.

Video Surveillance—Beyond Security

The use of video surveillance for security purposes is well established – just watch any of the “reality” television shows that show break-ins caught on video. Being able to document intrusions after hours, hold-ups, etc., remains a popular justification for video surveillance systems. Today, though, forward thinking managers and business owners are finding new ways to employ the technol-

ogy that extends their reach both in geography and time. Even a great manager can’t be everywhere at once, but a well-designed video surveillance system can allow that manager to see what’s going on in many different places, even while at home or on the road. Imagine being able to look in at the third shift in your manufacturing facility to help troubleshoot quality problems, or to immediately

identify the reason for a production line stoppage, or to review video of an on-the-job injury occurrence.

24/7/365 Peace of Mind

We live in a 24/7 world today. Plants operate around the clock. Facilities in remote locations are on different time zones. Managers want to see what’s going on in their far flung operations, and now IP-based video feeds can make that happen. Whether the manager is at home on a Saturday night or at an Internet café in Hong

Kong, a secure video feed can be available to check on operations down the block or around the globe.

CompStar Technologies brings unique skills to each video project. CompStar combines a strong background in data networking and security with a thorough understanding of video surveillance and security applications. CompStar can bridge the gap between your video data and your data and voice network infrastructure.
